

INTELLIGENT TALENT-TO-PROJECT ALIGNMENT SYSTEM

A Data-Driven Framework for Optimizing Technical Workforce Allocation

Femachi Ajoku & Peter Egessa · Intelligent Systems & Workforce Development

SECTION 1 — PROBLEM STATEMENT

The Challenge

Modern organizations assign talent using **static proxies** — résumés, job titles, and years of experience — that fail to capture real, current technical capability.

Problems for Employees

- Assigned work rarely aligns with actual technical strengths
- No visibility into how performance affects future opportunities
- Generic training wastes time on already-mastered skills
- Career progression blocked by title, not capability

Problems for Organizations

- Keyword matching instead of competency-based evaluation
- Misaligned teams → reduced velocity & higher failure rates
- Underutilized talent across departments goes undetected
- No feedback mechanism from past allocation decisions

"Platforms like Jira and Asana track tasks — not talent. The gap is wide open."

SECTION 3 — PROPOSED SOLUTION

Concept Overview

An intelligent closed-loop allocation framework that continuously evaluates live skill profiles and dynamically aligns individuals to evolving project requirements.

Core Idea

Instead of static assignment: every project cycle feeds performance data back into the model — automatically improving future matching accuracy.

System Architecture

SECTION 5 — INNOVATION

Traditional vs. Our System

✗ TRADITIONAL METHODS	✓ OUR DYNAMIC SYSTEM
✗ Static résumé-based assignment	✓ Dynamic competency-based alignment
✗ Keyword matching only	✓ Multi-dimensional skill scoring
✗ Manual, gut-feel decisions	✓ Data-driven automated framework
✗ No adaptability after assignment	✓ Continuous iterative optimization
✗ Siloed learning & HR systems	✓ Unified closed-loop intelligence

SECTION 2 — OBJECTIVES

Project Goals

- Evaluate multi-dimensional technical competencies beyond credentials and titles
- Enable dynamic, real-time matching of skill profiles to active project requirements
- Reduce team formation time while improving assignment accuracy and scalability
- Introduce a continuous feedback loop that refines allocation decisions over time

SECTION 4 — METHODOLOGY

Approach

A structured, multi-factor evaluation framework assesses alignment between individuals and project requirements, using iterative feedback to sharpen matching accuracy over time.

Methodological Elements

- Assessment Framework**
Structured scoring across 6+ technical skill dimensions — depth and breadth
- Pattern Analysis**
Evaluates skill relevance relative to real, live project context
- Adaptive Matching**
Aligns individuals to tasks using live profile data, not static records
- Iterative Refinement**
Feedback integration sharpens accuracy with every project cycle

Rigor & Feasibility

- ✓ Scalable across teams, departments, and organizations
- ✓ Compatible with existing PM ecosystems (Jira, Asana, etc.)
- ✓ Supports real-time decision-making environments

⚠ Certain technical components are proprietary and have been intentionally abstracted.

SECTION 6 — REAL-WORLD IMPACT

Expected Outcomes

- Reduced Team Formation Time**
↑ Skill-matched teams deliver faster & more reliably
- Enhanced Workforce Utilization**
↓ No more hidden talent — full visibility across org
- Higher Project Success Rates**
🔄 Personalized learning paths cut time-to-expertise
- Continuous loop eliminates stale team configurations

Scalability

- Software engineering & product teams
- IT service & support organizations
- Technical training & upskilling platforms

UN Sustainable Development Goals

- SDG 8: Decent Work & Growth**
Optimized workforce allocation & productive employment
- SDG 9: Industry & Innovation**
AI-driven methodology transforms talent deployment
- SDG 4: Quality Education**
Adaptive learning accelerates individual skill growth
- SDG 10: Reduced Inequalities**
Merit-based matching removes title & tenure bias

SECTION 7 — ENTREPRENEURIAL THINKING

Problem-Solving Approach

- Identifies the inefficiency gap in workforce allocation
- Applies structured analytical thinking to redesign the assignment process
- Bridges the gap between technical capability and project demand

Market Opportunity

No existing tool unifies **skill assessment + team formation + adaptive learning** into one continuous intelligence loop. This is a new product category.

- Growing Demand**
Intelligent workforce tools expanding rapidly across industries
- Enterprise Integration**
REST API layer for Jira, Workday, SAP SuccessFactors
- SaaS Deployment**
Scalable subscription tiers by team size & usage volume

Competitive Moat

- Proprietary competency evaluation engine (intentionally abstracted)
- Target: upskilling companies, enterprise HR tech, training platforms

🌐 Deployable as SaaS with tiered subscription by team size and usage volume.

SECTION 8 — FUTURE WORK

Next Steps

- Refine proprietary evaluation models using live organizational datasets
- Expand with real-world pilot testing across 2-3 partner companies
- Build native integrations with enterprise PM and HRIS platforms
- Optimize matching algorithm performance at scale using production feedback
